1 Objectives

The primary objective of the study was to assess the survival, the risk of relapse and GVHD of patients who underwent allogenic sterm-cell transplantation (alloSCT) for aggressive T-cell lymphomas. The second objective was to determine the variables associated with these outcomes.

2 Methods

A retrospective analysis was conducted. A descriptive analysis of the variables recorded was perfomed.Different endpoints were defined : death, Event Free Survival (EFC), GRFS. GRFS was defined as death,progression/relapse, grade 3-4 acute GVHD or extensive chronic GVHD.

Survival curves were estimated using Kaplan-Meier product-limit estimator. Competing risk survival analysis methods were applied to estimate the cumulative incidence (CIF) of developing events over time from alloSCT. These methods allow for the fact that a patient may experience an event which is different from that of interest. These events are known as competing risk events, and may preclude the onset of the event of interest, or may modify the probability of the onset of that event.In particular, a transplanted patient may die before a relapse occurs.

Factors associated with overall sur-vival were analyzed using Cox proportional hazards models. The proportional hazards assumption was checked by examination of Schoenfeld residuals. Occurence of a grade 3-4 acute GVHD or chronic GVHD was treated as a time dependent covariable. For the different endpoints, univariable analyses were first carried out, then a multivariable analysis was used where all factors with P-value < 0.05 in the univariable analyses were considered. If needed, factors where then sequentially removed from the adjusted model based on the AIC criteria.

3 Results

3.1 Descriptive results

285 patients were initially selected.We excluded 1 patient that underwent two alloSCT. The final analysis was perfomed on 284 patients and 284 grafts.

Table 5: Characteristics according to conditionning MAC vs RIC

3.2 Survival analysis in all patients

3.2.1 Overall survival, EFS and GRFS

Median follow-up was 20.18 (range 0.03 to 112.83). OS at 1 year was 0.68 (95 % 0.62 - 0.73), was 0.64 (95 % 0.58 - 0.7) at 2 years.OS at 4 years was 0.57 (95 % 0.5 - 0.63).

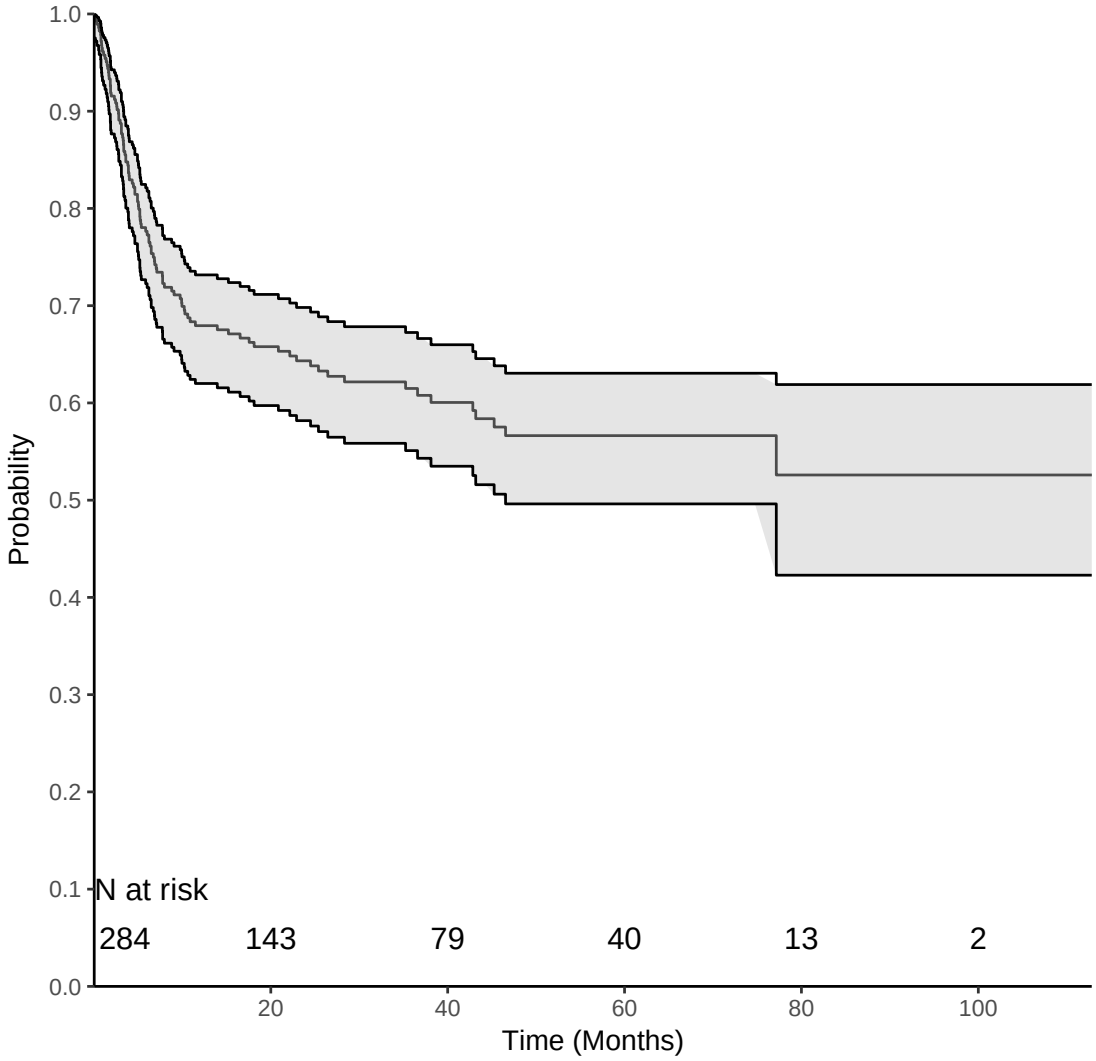

Figure 1: Overall survival

CIF for relapse/progression at 1 years was 0.18 (95 % 0.13 - 0.23), at 2 years 0.19 (95 % 0.15 - 0.24). CIF for death without relapse or progression at 1 year was 0.19 (95 % 0.14 - 0.24), at 2 years 0.22 (95 % 0.17 - 0.27).

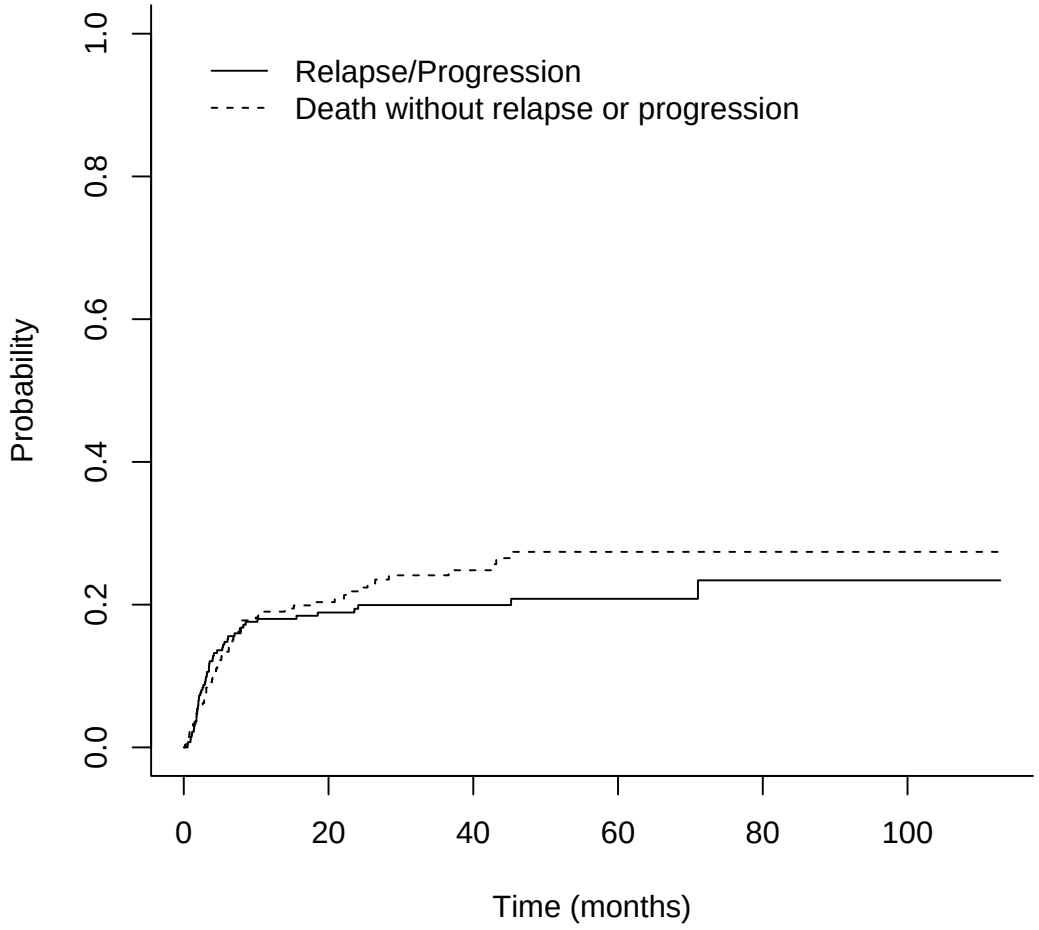

Figure 2: CIF of relapse or progression and death without relapse or progression

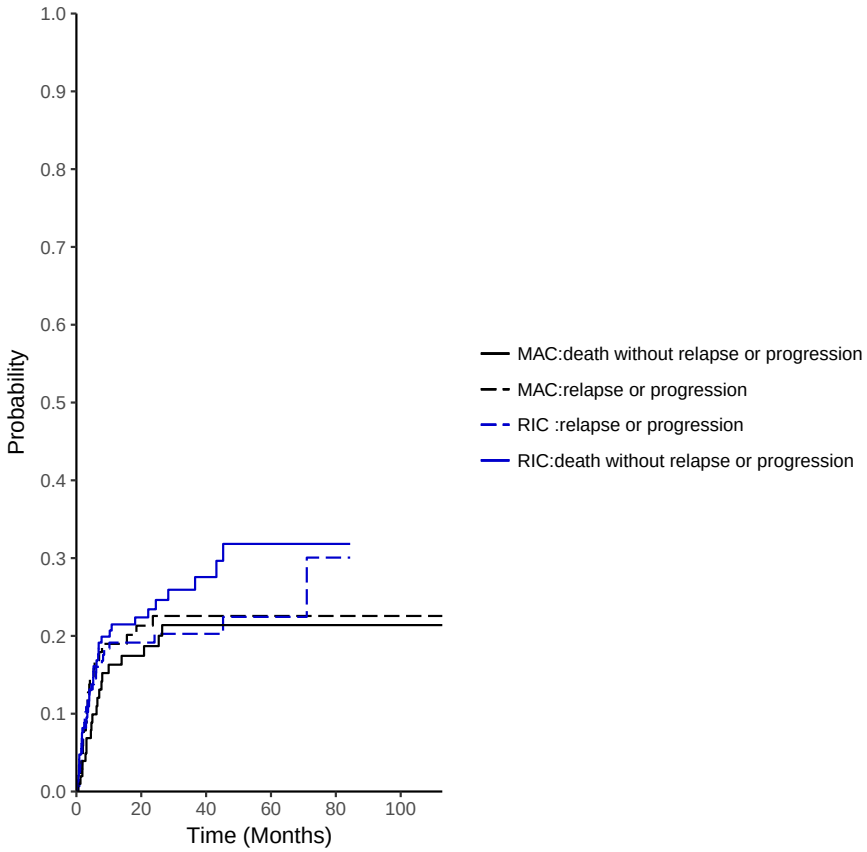

Figure 3: CIF of relapse or progression and death without relapse or progression according to conditionning
CIF of relapse or progression with MAC at 1 year : 0.19, was 0.23 at 2 years. CIF of relapse or progression with RIC at 1 year : 0.19, was 0.19 at 2 years.

EFS at 1 year was 0.63 (95 % 0.57 - 0.69), was 0.59 (95 % 0.53 - 0.65) at 2 years. EFS at 4 years was 0.52 (95 % 0.45 - 0.59).
Délai médian rechute : 94 jours.
GRFS at 1 year was 0.49 (95 % 0.44 - 0.56), was 0.47 (95 % 0.41 - 0.54) at 2 years. GRFS at 4 years was 0.43 (95 % 0.37 - 0.5).

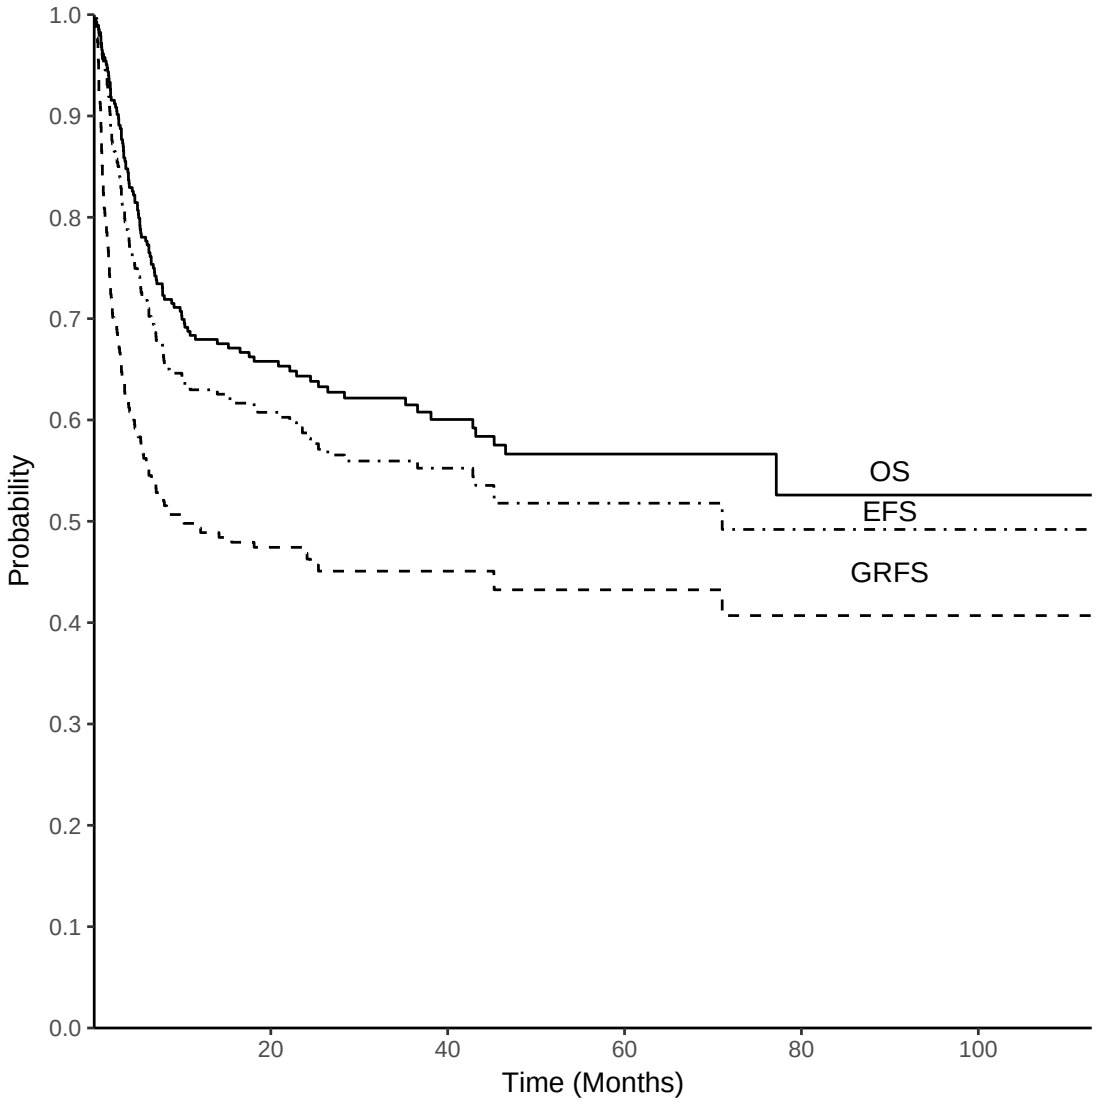

Figure 4: EFS and GRFS

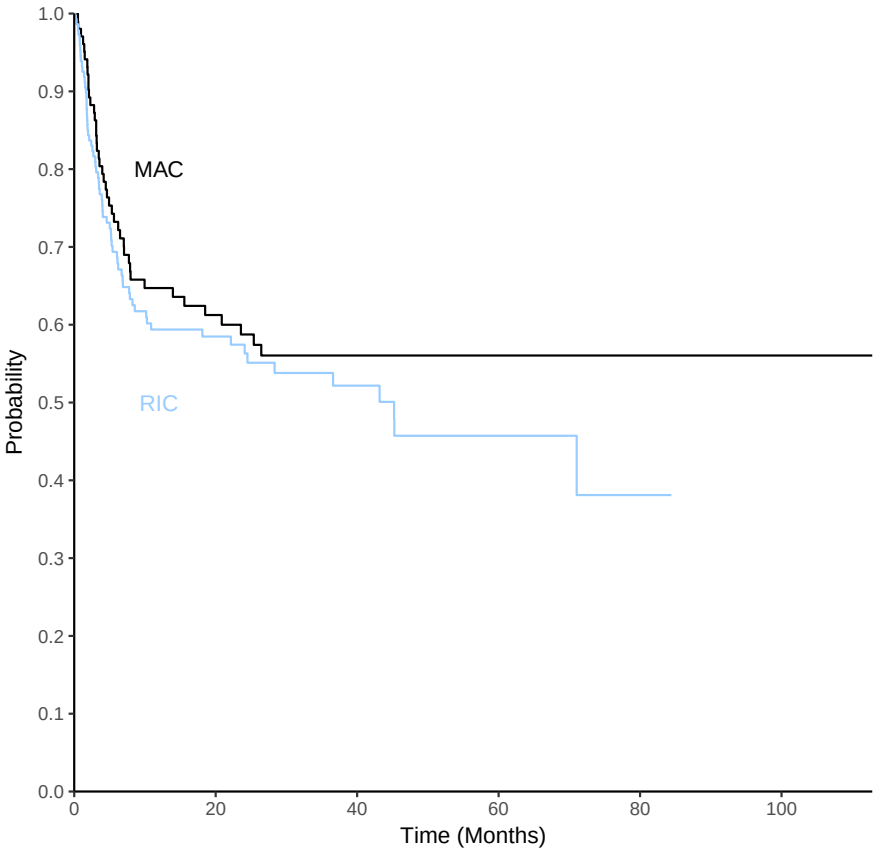

Figure 5: EFS according to conditionning
EFS MAC : 1 year : 0.65 (95 % 0.56 - 0.75) 2 year : 0.59 (95 % 0.5 - 0.7)
EFS RIC : 1 year : 0.75 (95 % 0.69 - 0.83) 2 year : 0.69 (95 % 0.62 - 0.77)

3.2.2 TRM and cause of death

TRM at 1 year was 0.22 (95 % 0.27 - 0.17), was 0.24 (95 % 0.3 - 0.19) at 2 years. TRM at 4 years was 0.3 (95 % 0.37 - 0.24).

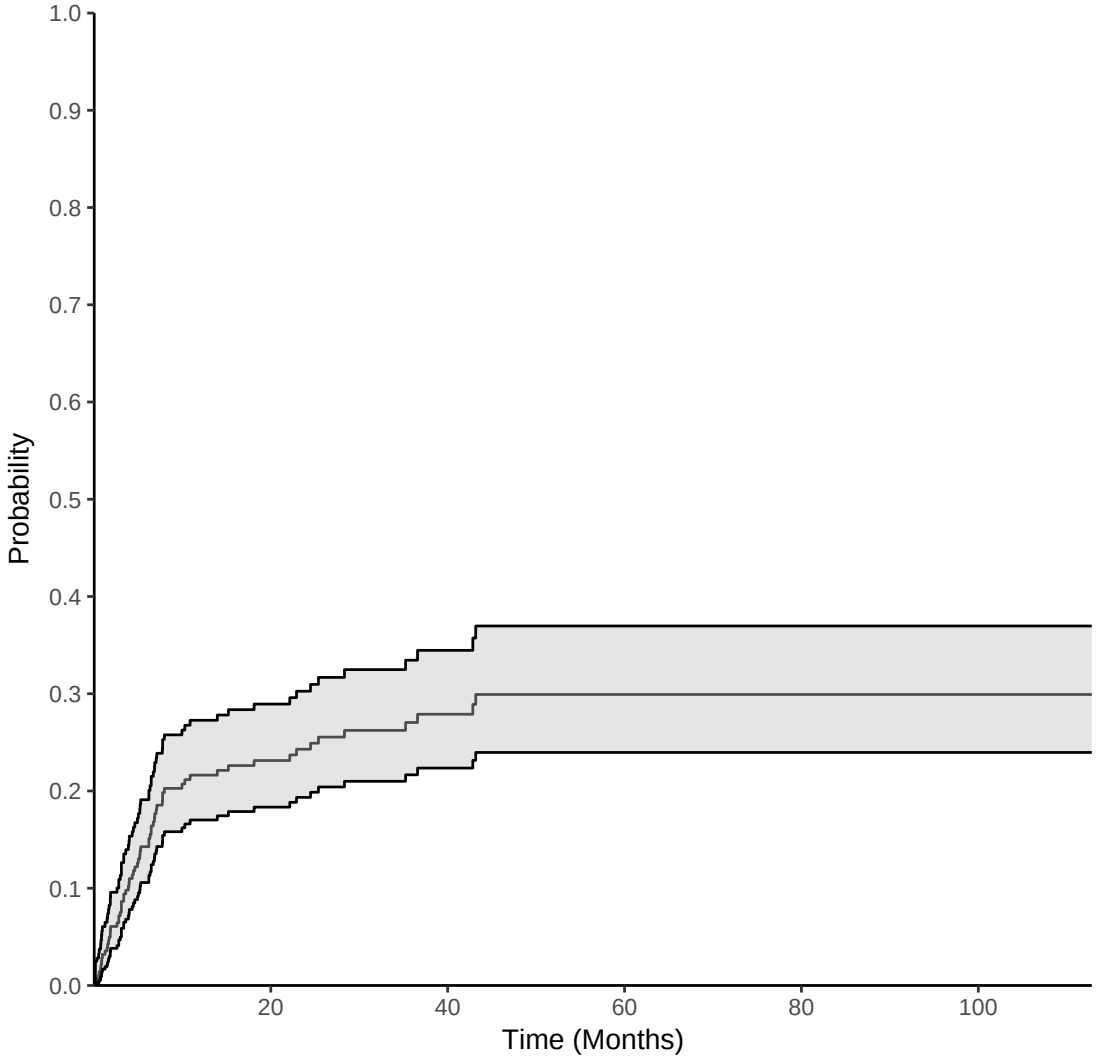

Figure 6: TRM

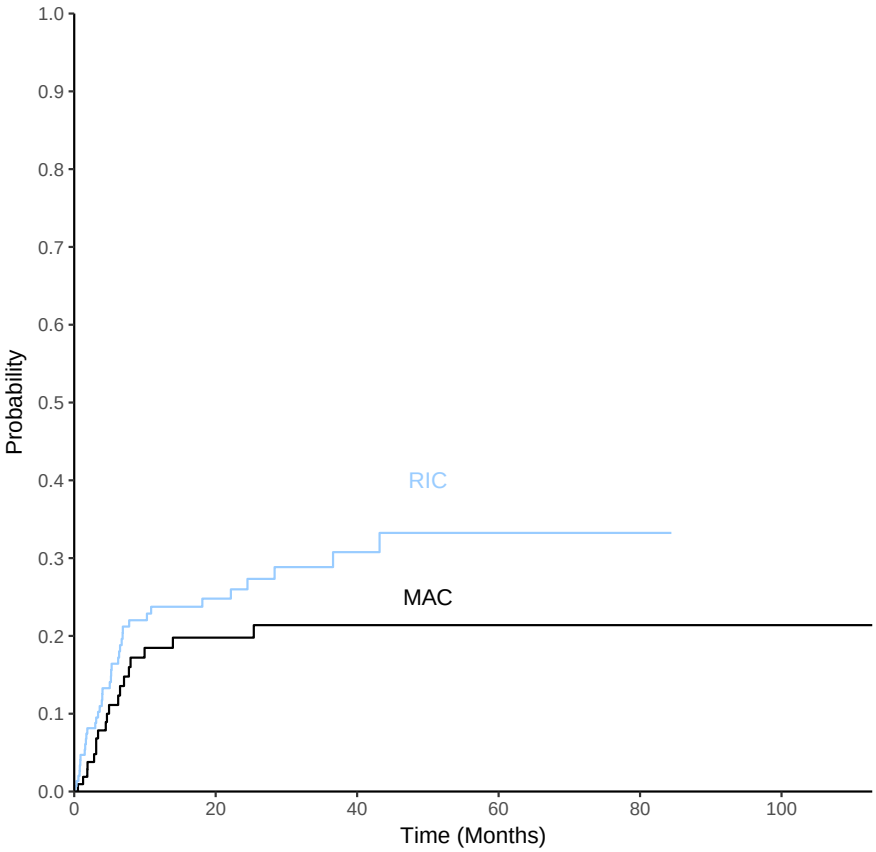

Figure 7: TRM according to conditionning
TRM MAC : 1 year : 0.18 (95 % 0.26 - 0.1) 2 year : 0.2 (95 % 0.28 - 0.11)
TRM RIC : 1 year : 0.16 (95 % 0.21 - 0.09) 2 year : 0.21 (95 % 0.28 - 0.14)

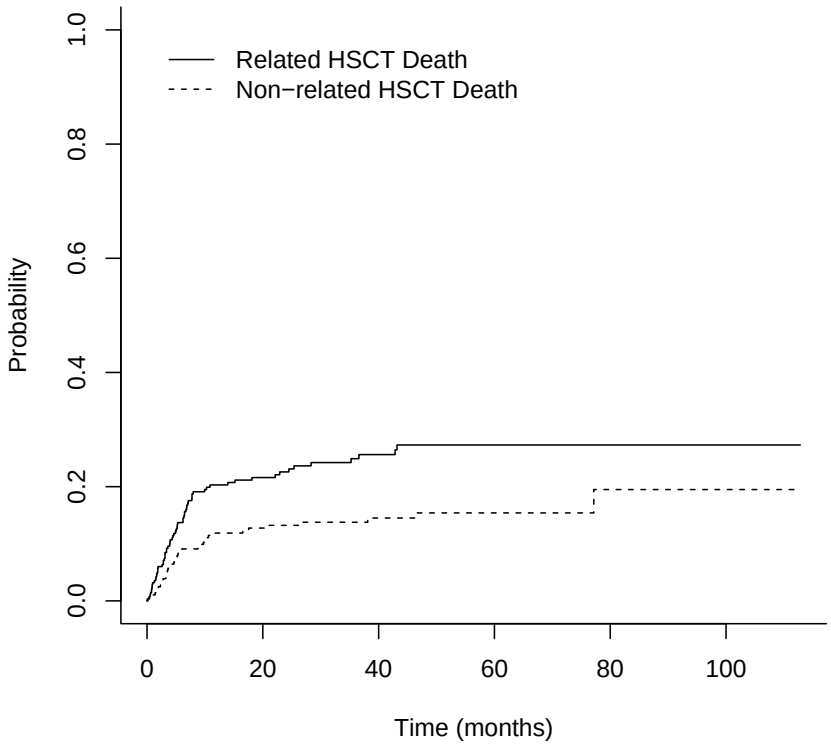

Figure 8: CIF of Related HSCT Death and Non-related HSCT Death

CIF for related HSCT death at 1 years was 0.2, at 2 years 0.23. CIF for non-related HSCT Death at 1 year was 0.12, at 2 years 0.13.

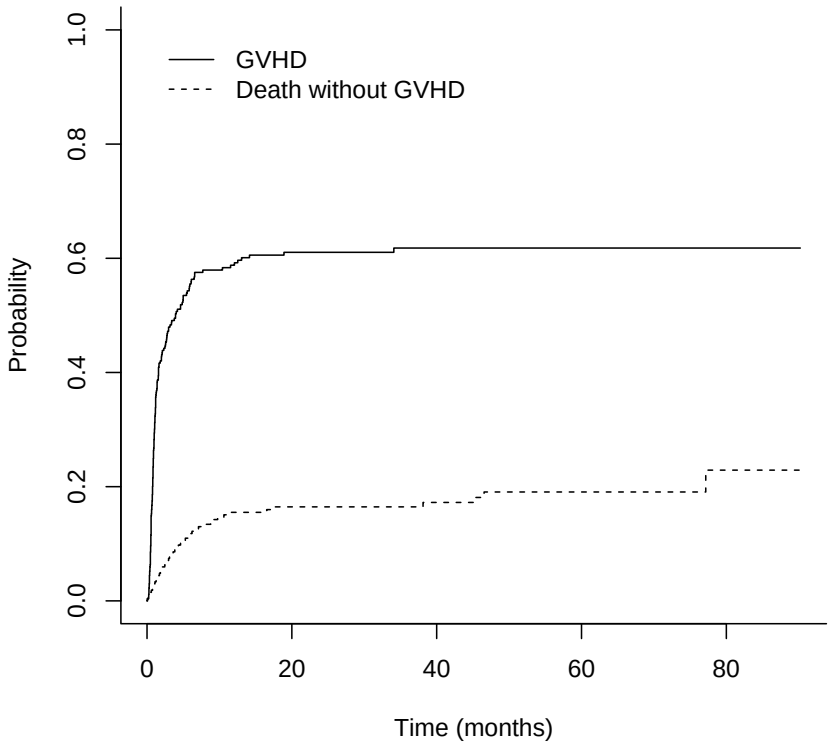

Figure 9: CIF of GVHD and Death without GVHD (acute or chronic)

3.3 Survival analysis after a complete remisson post alloSCT

245 patients whith a complete remission were included.
OS at 1 year was 0.74 (95 % 0.68 - 0.8), was 0.7 (95 % 0.64 - 0.76) at 2 years. OS at 4 years was 0.62 (95 % 0.56 - 0.7).

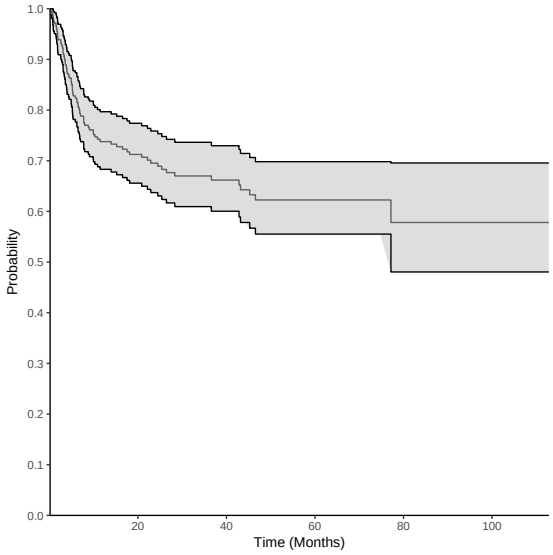

Figure 10: OS in patients with a complete remission post alloSCT

CIF for relapse at 1 year was 0.12 (95 % 0.07 - 0.16), at 2 years 0.13 (95 % 0.09 - 0.18). CIF for death without relapse at 1 year was 0.19 (95 % 0.14 - 0.24), at 2 years 0.22 (95 % 0.17 - 0.28).

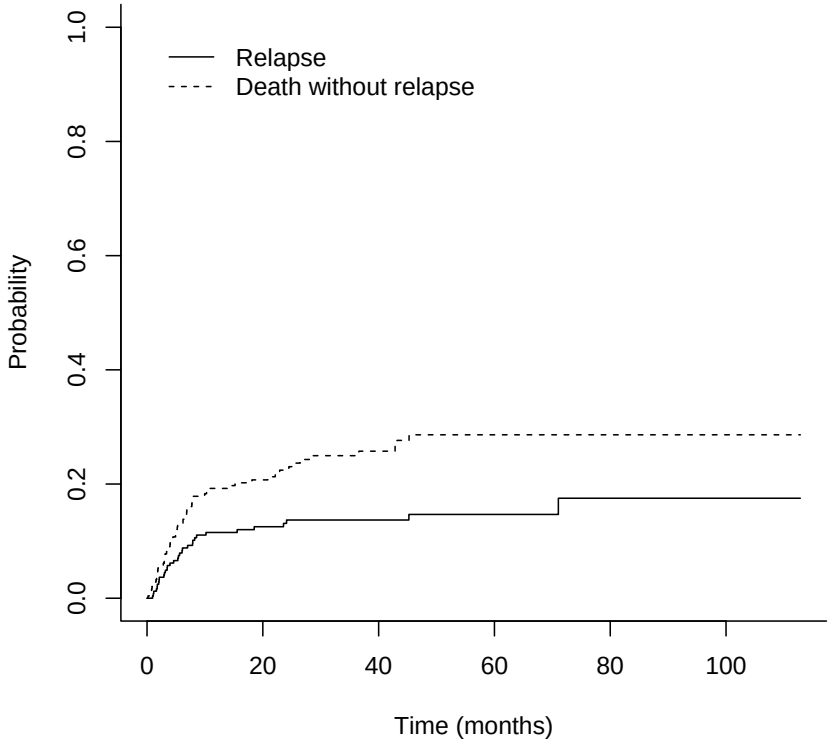

Figure 11: CIF of relapse and death without relapse (in patients with a complete remission post alloSCT)

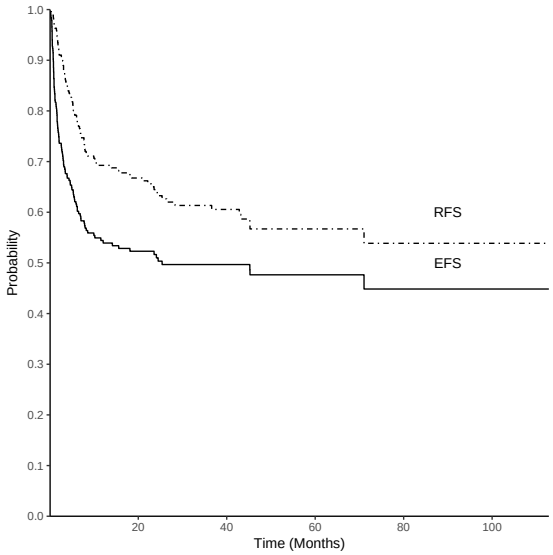

Figure 12: RFS and EFS in patients with a complete remission post alloSCT

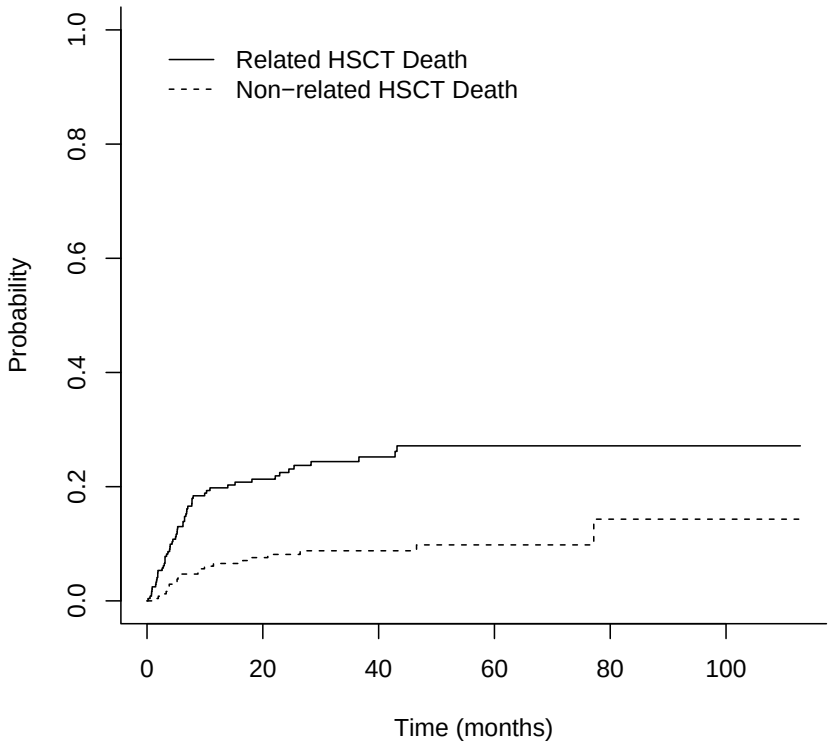

Figure 13: CIF of Related HSCT Death and Non-related HSCT Death (in patients with a complete remission post alloSCT)

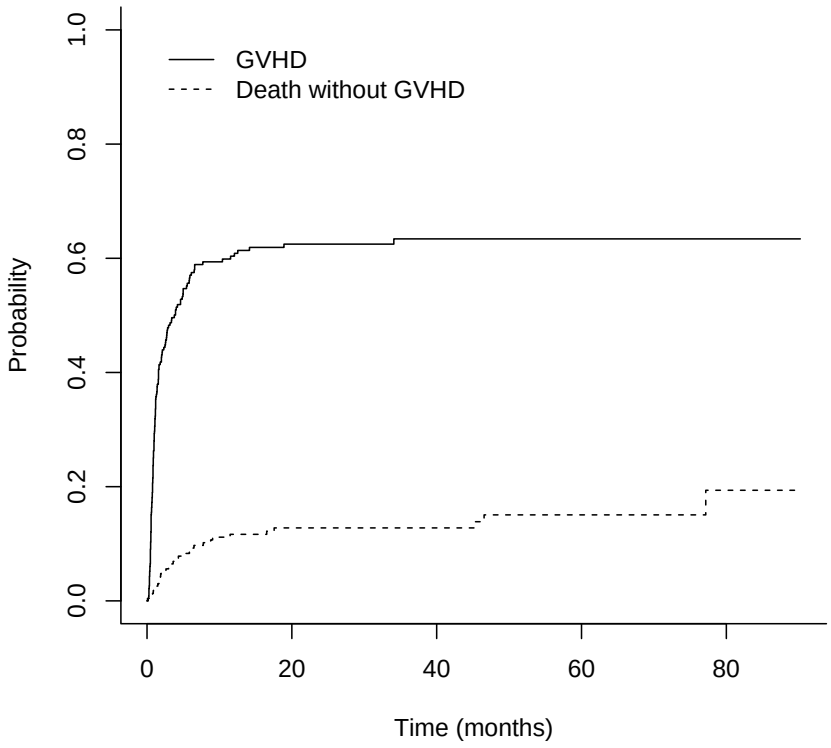

Figure 14: CIF of GVHD and Death without GVHD (acute or chronic)(in patients with a complete remission post alloSCT)
